

README: Replicating ‘The Limits (and Strengths) of Single-Topic Experiments’

Reproduction tl;dr

The code below (or `make-figures.R`) creates both figures in the paper. The code runs almost instantly.

The file `install-packages.R` (written dynamically below) will install all the packages I use for this project in the appropriate version. Please run if you want to use the same package versions as I did.

```
# remove all generated files
file.remove("figure1.png", "figure2.png")

# run the code that makes the two figures in the paper
source("make-figures.R")
```

Output

The code produces two figures:

- `figure1.png`, which corresponds to Figure 1 in the paper.
- `figure2.png`, which corresponds to Figure 1 in the paper.

Session Information

```

8 sessioninfo 1.2.2
9     tibble 3.2.1
10 tidyverse 2.0.0
```

Write Script to Install Packages and Versions

```
# create a new script file
script_file <- file("install-packages.R", "w")

# write install.packages() commands for each package to the file
for (i in 1:nrow(dep)) {
  install_cmd <- sprintf("remotes::install_version('%s', version = '%s', repos = 'http://c
  cat(install_cmd, file = script_file, append = TRUE)
}

# close the file
close(script_file)
```
